Enterprise Integration
For Microsoft Windows
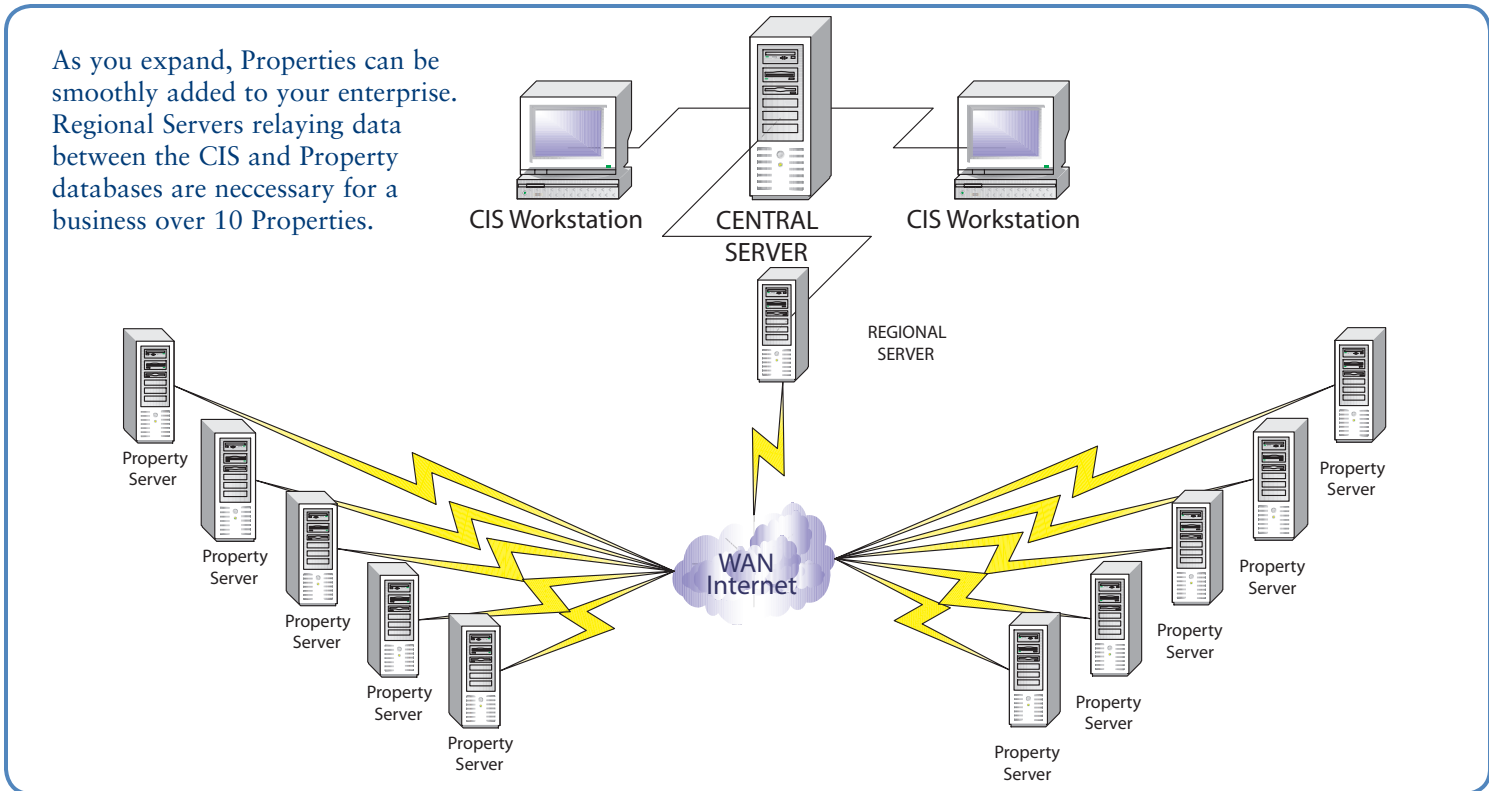

Streamline Data and Operations

The ability to quickly and accurately exchange data between your corporate office and your properties helps you increase your knowledge, empower your enterprise and realize results. Hotel Information Systems (HIS) offers epitome Enterprise Integration to manage the exchange of your data so you can increase revenue and streamline operations.

epitome Enterprise Integration is the global solution for exchanging valuable information between a central source and an enterprise of subscribing properties. Scalable to multiple tiers containing numerous subscribing data sources, epitome Enterprise Integration distributes your global data throughout the enterprise while limiting property specific data transfer between the Central Information System (CIS) and a single property. Information is no longer limited to a single source as it can now be accessed, manipulated and managed centrally and then re-distributed throughout the enterprise.
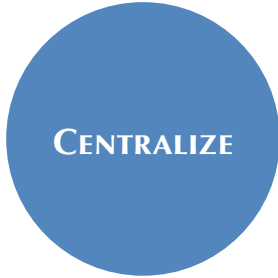

Product Overview

epitome Enterprise Integration uses Microsoft SQL Server Replication to copy and distribute data and database objects from one database to another in a Windows-based platform environment. Synchronizing between databases for consistency, Merge (bi-directional) Replication allows various sites to work autonomously while updating each other through a CIS. Packaged with HIS-developed tools, Replication is a viable and dynamic option that you can use to link multiple properties throughout your enterprise.

The CIS database is a centralized distribution point for the property databases in your enterprise. Property information collected into the CIS database flows back and forth between the CIS and stand-alone property Servers. Pre-configured data flow filters control the information your properties share or maintain locally. Global information, including Sales, Travel Agency, Guest and Company

As you expand, Properties can be smoothly added to your enterprise. Regional Servers relaying data between the CIS and Property databases are neccessary for a business over 10 Properties.

INTEGRATE

History can now be shared throughout the enterprise, allowing access and control to users at each one of your properties and/or CIS. Furthermore, transactional information pertaining only to a single property is limited to an exchange between CIS and the property.

Summary

You need accurate and up-to-the-minute information to streamline your operation, reduce costs and increase revenue. As your enterprise grows so can epitome Enterprise Integration. Pre-defined filters, set up at the publishing CIS server, allow the smooth integration of up to a hundred properties to the global environment. Within a day, a new property can join the enterprise of subscribing properties and quickly distribute data to your CIS and other property subscribers. When the new property is online, Global data immediately populates the subscriber from the CIS publisher. Beyond ten data sources, Regional servers share the load and distribution of your data through two tiers of epitome Enterprise Integration. Along with our stand-alone server option, the HIS Multi-property solution also integrates easily into the enterprise. With just a few clicks company-wide changes are integrated throughout the enterprise.
